ABSTRACTED-PUB-NO: SU 516126A

BASIC-ABSTRACT:

The carbon fluoride cathode is stable and non-hygroscopic in normal temp. conditions, and specific capacity is raised 15-20% above the previous value of 0.85 amp.hr. The cathode material is of formula  $(CF_x)_n$  (where x is 1.0-1.5)

In an example, the carbon fluoride was powdered and mixed with a polymeric binder and an electrically conducting additive, such as an acetylenic carbon black, in the ratio 1:0.2:0.2, pressed onto a lattice at 100 kg./cm.<sup>2</sup>, then heated to the softening point of the polymer. The electrode was combined with the lithium electrode and made into a pack using polypropylene as the electrode divider, and impregnated with a soln. of lithium perchlorate in propylene carbonate.
